Humanitas

A prediction tool for volatile commodity prices in developing countries

Students: Alexander John Busser, Anton Ovchinnikov, Ching-Chia Wang, Duy Nguyen, Fabian Brix, Gabriel Grill, Julien Graisse, Joseph Boyd, Stefan Mihaila

Price Transmission Analysis

Interpretation

automate interpretation to a certain extent by learning about circumstances through online data.

Prediction Models

Echo State Networks (ESN)

Echo State Networks are a type of Recurrent Neural Network (RNN) applicable to many domains because unlike other RNNs they are easy to train.

[?] The third section explains how echo state networks can be trained in a supervised way. The natural approach here is to adapt only the weights of network-to-output connections. Essentially, this trains readout functions which transform the echo state into the desired output signal. Technically, this amounts to a linear regression task.

Echo States

For our task we need a discrete time neural network which is incidentally also the constraint in which Echo State Networks are defined. The ESN is assumed to have N input units, K internal network units and L output units. Direct connections from input to output units and from output to output units are allowed.

Training ESN
